## Pythagorean Triplets

## Euclid's formula for generating all the primitive pythagorean triplets (PPT's)

$$
a^{2}+b^{2}=c^{2}
$$

Since $a, b$ and $c$ have no common factors, either $a$ or $b$ or both must be odd.
Suppose that $a$ and $b$ are both odd (and $c$ is even). We can therefore write:

$$
(2 p+1)^{2}+(2 q+1)^{2}=(2 r)^{2}
$$

Where $p, q$ and $r$ are integers.
In which case

$$
\begin{gathered}
4 p^{2}+4 p+1+4 q^{2}+4 q+1=4 r^{2} \\
2\left(p^{2}+p+q^{2}+q\right)=2 r^{2}-1
\end{gathered}
$$

Now the left hand side of this equation is even and the right hand side is odd. This is a contradiction so our assumption that $a$ and $b$ are both odd is wrong.

Let us suppose that $a$ is odd and $b$ is even. This means that $c$ must be odd. It also implies that $c+a$ and $c-a$ must both be even. We can therefore write

$$
\begin{aligned}
& p=(c+a) / 2 \\
& q=(c-a) / 2
\end{aligned}
$$

Where $p$ and $q$ are integers.
In which case

$$
\begin{aligned}
& a=p-q \\
& c=p+q
\end{aligned}
$$

and

$$
b=\sqrt{4 p q}
$$

Now if $p$ and $q$ have a common factor, $a, b$ and $c$ will share the same factor and the triplet will not be primitive. $p$ and $q$ must therefore be co-prime.
If that is the case, then in order for $4 p q$ to have an integer square root, both $p$ and $q$ must be perfect squares. Suppose $p=m^{2}$ and $q=n^{2}$. Then

$$
\begin{gathered}
a=m^{2}-n^{2} \\
b=2 m n \\
c=m^{2}+n^{2}
\end{gathered}
$$

where $m$ and $n$ are co-prime, $m>n$ and one only is odd.
Here is a table of possible values of $m$ and $n$.

| $m$ | $n$ | $a$ | $b$ | $c$ |
| :---: | :---: | :---: | :---: | :---: |
| 2 | 1 | 3 | 4 | 5 |
| 3 | 2 | 5 | 12 | 13 |
| 4 | 1 | 15 | 8 | 17 |
| 4 | 3 | 7 | 24 | 25 |
| 5 | 2 | 21 | 20 | 29 |
| 5 | 4 | 9 | 40 | 41 |
| 6 | 1 | 35 | 12 | 37 |
| 6 | 3 | 27 | 36 | 45 |
| 6 | 5 | 11 | 60 | 61 |
| 7 | 2 | 45 | 28 | 53 |
| 7 | 4 | 33 | 56 | 65 |
| 7 | 6 | 13 | 84 | 85 |
| 8 | 1 | 63 | 16 | 65 |
| 8 | 3 | 55 | 48 | 73 |
| 8 | 5 | 39 | 80 | 89 |
| 8 | 7 | 15 | 112 | 113 |

(The entry for 63 has been greyed out because 6 and 3 are not co-prime.)

## Another formula for generating all the primitive pythagorean triplets (PPT's)

Let us write $a=c-g$ and $b=c-h$ then

$$
\begin{gathered}
(c-g)^{2}+(c-h)^{2}=c^{2} \\
c^{2}-2 c g+g^{2}+c^{2}-2 c h+h^{2}=c^{2} \\
c^{2}-2(g+h) c+g^{2}+h^{2}=0
\end{gathered}
$$

from which we determine that

$$
\begin{gathered}
c=g+h+i \\
a=h+i \\
b=g+i \\
\text { where } \quad i=\sqrt{(2 g h)}
\end{gathered}
$$

[It is easy to show that $\mathrm{a}+b$ must be greater than $c$ and therefore that the square root cannot be negative]

Suppose that $g$ and $h$ have a common factor $p$. Then $i$ will also have the factor $p$. In fact, all three numbers $a, b$ and $c$ will have the same factor and the triplet will not be primitive. Hence $g$ and $h$ must be co-prime.

Since the expression must have an integral square root, then all the prime factors of $g$ and $h$ greater than 2 must appear in pairs and one of the two numbers must have an odd number of factors of 2 .

These conditions can be met in the following way. Take any two co-prime integers $u$ and $v$ with $u$ being odd. Then $g=u^{2}, \quad h=2 v^{2}$ and $i=2 u v$

The following table gives the 16 possible values of $u$ and $v$ which generate triplets with $c<100$.

| $u$ | $v$ | $g$ | $h$ | $i$ | $a$ | $b$ | $c$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | 1 | 2 | 2 | 3 | 4 | 5 |
| 1 | 2 | 1 | 8 | 4 | 5 | 12 | 13 |
| 1 | 3 | 1 | 18 | 6 | 7 | 24 | 25 |
| 1 | 4 | 1 | 32 | 8 | 9 | 40 | 41 |
| 1 | 5 | 1 | 50 | 10 | 11 | 60 | 61 |
| 1 | 6 | 1 | 72 | 12 | 13 | 84 | 85 |
| 3 | 1 | 9 | 2 | 6 | 15 | 8 | 17 |
| 3 | 2 | 9 | 8 | 12 | 21 | 20 | 29 |
| 3 | 4 | 9 | 32 | 24 | 33 | 56 | 65 |
| 3 | 5 | 9 | 50 | 30 | 39 | 80 | 89 |
| 5 | 1 | 25 | 2 | 10 | 35 | 12 | 37 |
| 5 | 2 | 25 | 8 | 20 | 45 | 28 | 53 |
| 5 | 3 | 25 | 18 | 30 | 55 | 48 | 73 |
| 5 | 4 | 25 | 32 | 40 | 65 | 72 | 97 |
| 7 | 1 | 49 | 2 | 14 | 63 | 16 | 65 |
| 7 | 2 | 49 | 8 | 28 | 77 | 36 | 85 |

## Methods for generating particular series of triplets

Suppose we wish to generate all PPT's in which $c=a+1$.

$$
\begin{gathered}
a^{2}+b^{2}=(a+1)^{2} \\
b^{2}=2 a+1
\end{gathered}
$$

This is easily achieved with

$$
\begin{aligned}
& a=\left(b^{2}-1\right) / 2 \\
& c=\left(b^{2}+1\right) / 2
\end{aligned}
$$

for all odd $b$.
Putting $b=2 p+1$ we get:

$$
\begin{gathered}
a=2 n^{2}+2 n \\
b=2 n+1 \\
c=2 n^{2}+2 n+1
\end{gathered}
$$

| $n$ | $a$ | $b$ | $c$ |
| :---: | :---: | :---: | :---: |
| 1 | 4 | 3 | 5 |
| 2 | 12 | 5 | 13 |
| 3 | 24 | 7 | 25 |
| 4 | 40 | 9 | 41 |
| 5 | 60 | 11 | 61 |
| 6 | 84 | 13 | 85 |
| 7 | 112 | 15 | 113 |
| 8 | 144 | 17 | 145 |

Suppose we wish to generate all PPT's in which $c=a+2$.

$$
\begin{gathered}
a^{2}+b^{2}=(a+2)^{2} \\
b^{2}=4 a+4
\end{gathered}
$$

This is easily achieved with

$$
\begin{aligned}
& a=\left(b^{2}-4\right) / 4 \\
& c=\left(b^{2}+4\right) / 4
\end{aligned}
$$

Since this restrict $b$ to even numbers, $a$ (and $c$ ) must be odd. $b$ must therefore be even. Writing $b=$ $2 m$,

$$
\begin{gathered}
a=m^{2}-1 \\
b=2 m \\
c=m^{2}+1
\end{gathered}
$$

Since $b$ is even, $a$ must be odd which means that $m$ must also be even. Writing $m=2 n$ :

$$
\begin{gathered}
a=4 n^{2}-1 \\
b=4 n \\
c=4 n^{2}+1
\end{gathered}
$$

| $n$ | $a$ | $b$ | $c$ |
| :---: | :---: | :---: | :---: |
| 1 | 3 | 4 | 5 |
| 2 | 15 | 8 | 17 |
| 3 | 35 | 12 | 37 |
| 4 | 63 | 16 | 65 |
| 5 | 99 | 20 | 101 |
| 6 | 143 | 24 | 145 |
| 7 | 195 | 28 | 197 |
| 8 | 255 | 32 | 257 |

Suppose we wish to generate all PPT's in which $c=a+k$. ( $k$ is odd and $k>2$ )

$$
\begin{gathered}
a^{2}+b^{2}=(a+k)^{2} \\
b^{2}=2 a k+k^{2}
\end{gathered}
$$

which gives

$$
\begin{aligned}
& a=\left(b^{2}-k^{2}\right) / 2 k \\
& c=\left(b^{2}+k^{2}\right) / 2 k
\end{aligned}
$$

Now if $k$ contains a certain prime factor $p, b$ must also be divisible by $p$. It follows that $b^{2}$ will have two such prime factors and in consequence $a$ and $c$ will also have the same prime factor. If, on the other hand, $k$ contains two prime factors and $b$ one, they will cancel out. The argument can be extended to show that $k$ can only contain an even number of individual prime factors - or, to put it another way, $k$ must be a perfect square.
In which case $b$ must be a multiple of $\sqrt{k}$
If we write $b=n \sqrt{k}$ then:

$$
\begin{aligned}
& a=\left(n^{2} k-k^{2}\right) / 2 k=\left(n^{2}-k\right) / 2 \\
& c=\left(n^{2} k+k^{2}\right) / 2 k=\left(n^{2}+k\right) / 2
\end{aligned}
$$

from which we see that $n$ must be co-prime with $k$ and $n$ and $k$ must have the same parity.
The following table shows some examples for $k=9$ (with certain values of $n$ which are not coprime greyed out.)

| $k$ | $n$ | $a$ | $b$ | $c$ |
| :---: | :---: | :---: | :---: | :---: |
| 9 | 5 | 8 | 15 | 17 |
|  | 7 | 20 | 21 | 29 |
|  | 9 | 36 | 27 | 45 |
|  | 11 | 56 | 33 | 65 |
|  | 13 | 80 | 39 | 89 |
|  | 15 | 108 | 45 | 117 |
|  | 17 | 140 | 51 | 149 |
|  | 19 | 176 | 57 | 185 |
|  |  |  |  |  |

Suppose we wish to generate all PPT's in which $c=a+k \quad(k$ even and $k>2)$
Write $k=2 j$ so that:

$$
\begin{gathered}
a^{2}+b^{2}=(a+2 j)^{2} \\
b^{2}=4 a j+4 j^{2}
\end{gathered}
$$

which gives

$$
\begin{aligned}
& a=\left(b^{2}-4 j^{2}\right) / 4 j=b^{2} / 4 j-j \\
& c=\left(b^{2}+4 j^{2}\right) / 4 j=b^{2} / 4 j+j
\end{aligned}
$$

Now if $j$ contains a certain prime factor $p, b$ must also be divisible by $p$. It follows that $b^{2}$ will have two such prime factors and in consequence $a$ and $c$ will also have the same prime factor. If, on the other hand, $j$ contains two prime factors and $b$ one, they will cancel out. The argument can be extended to show that $j$ can only contain an even number of individual prime factors - or, to put it another way, $j$ must be a perfect square.
In which case $b$ must be a multiple of $2 \sqrt{j}$
If we write $b=2 n \sqrt{j}$ then:

$$
\begin{aligned}
& a=4 n^{2} j / 4 j-j=n^{2}-j \\
& c=4 n^{2} j / 4 j+j=n^{2}+j
\end{aligned}
$$

from which we see that $n$ must be co-prime with $j$.
In addition, since $b$ is always even, $n$ must not have the same parity as $j$. This is evident from the following table for $k=18$

| $j$ | $k$ | $n$ | $\mathbf{a}$ | $\boldsymbol{b}$ | $\boldsymbol{c}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{j}$ | $\mathbf{1 8}$ | 4 | 7 | 24 | 25 |
|  |  | 6 | 27 | 36 | 45 |
|  |  | 8 | 55 | 48 | 73 |
|  |  | 10 | 91 | 60 | 109 |
|  |  | 12 | 135 | 72 | 153 |
|  |  | 14 | 187 | 84 | 205 |
|  |  | 16 | 247 | 96 | 265 |
|  |  | 18 | 315 | 108 | 333 |

The values of $k$ which are valid are therefore:

$$
1,2,8,9,18,25,49,50,72,81,98,121,128 \text { etc. }
$$

In the following table, Euclid's method has been used to generate a complete list of all the primitive pythagorean triplets together with their respective even and odd differences ( $c-a$ and $c-b$ respectively).

| m | $n$ | a | b | c | k | k |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | 1 | 3 | 4 | 5 | 2 | 1 |
| 3 | 2 | 5 | 12 | 13 | 8 | 1 |
| 4 | 1 | 15 | 8 | 17 | 2 | 9 |
| 4 | 3 | 7 | 24 | 25 | 18 | 1 |
| 5 | 2 | 21 | 20 | 29 | 8 | 9 |
| 5 | 4 | 9 | 40 | 41 | 32 | 1 |
| 6 | 1 | 35 | 12 | 37 | 2 | 25 |
| 6 | 5 | 11 | 60 | 61 | 50 | 1 |
| 7 | 2 | 45 | 28 | 53 | 8 | 25 |
| 7 | 4 | 33 | 56 | 65 | 32 | 9 |
| 7 | 6 | 13 | 84 | 85 | 72 | 1 |
| 8 | 1 | 63 | 16 | 65 | 2 | 49 |
| 8 | 3 | 55 | 48 | 73 | 18 | 25 |
| 8 | 5 | 39 | 80 | 89 | 50 | 9 |
| 8 | 7 | 15 | 112 | 113 | 98 | 1 |
| 9 | 2 | 77 | 36 | 85 | 8 | 49 |
| 9 | 4 | 65 | 72 | 97 | 32 | 25 |
| 9 | 8 | 17 | 144 | 145 | 128 | 1 |
| 10 | 1 | 99 | 20 | 101 | 2 | 81 |
| 10 | 3 | 91 | 60 | 109 | 18 | 49 |
| 10 | 7 | 51 | 140 | 149 | 98 | 9 |
| 10 | 9 | 19 | 180 | 181 | 162 | 1 |
| 11 | 2 | 117 | 44 | 125 | 8 | 81 |
| 11 | 4 | 105 | 88 | 137 | 32 | 49 |
| 11 | 6 | 85 | 132 | 157 | 72 | 25 |
| 11 | 8 | 57 | 176 | 185 | 128 | 9 |
| 11 | 10 | 21 | 220 | 221 | 200 | 1 |
| 12 | 1 | 143 | 24 | 145 | 2 | 121 |
| 12 | 5 | 119 | 120 | 169 | 50 | 49 |
| 12 | 7 | 95 | 168 | 193 | 98 | 25 |
| 12 | 11 | 23 | 264 | 265 | 242 | 1 |
| 13 | 2 | 165 | 52 | 173 | 8 | 121 |
| 13 | 4 | 153 | 104 | 185 | 32 | 81 |
| 13 | 6 | 133 | 156 | 205 | 72 | 49 |
| 13 | 8 | 105 | 208 | 233 | 128 | 25 |
| 13 | 10 | 69 | 260 | 269 | 200 | 9 |
| 13 | 12 | 25 | 312 | 313 | 288 | 1 |
| 14 | 1 | 195 | 28 | 197 | 2 | 169 |
| 14 | 3 | 187 | 84 | 205 | 18 | 121 |
| 14 | 5 | 171 | 140 | 221 | 50 | 81 |
| 14 | 9 | 115 | 252 | 277 | 162 | 25 |
| 14 | 11 | 75 | 308 | 317 | 242 | 9 |
| 14 | 13 | 27 | 364 | 365 | 338 | 1 |
